SS2 - Introduction to Aircraft Structures

OBJECTIVES

This course is an introduction to the preliminary design of aircraft structures. It is mainly focused on the basic concerns required before pre-sizing aircraft structures. The general architecture of aircraft structures is described to justify the interest in the use of the Beam Theory. The Beam Theory is then reminded then focused on the thin walled sections and hyperstaticity. It is then applied to analysis of load transfer within joints. A particular emphasis on the stress analysis on thin walled structure is offered through the presentation of an industrial case. Finally, a fundamental opening on Fatigue and Damage Tolerance (F&DT) applied to aircraft structures is offered from an industrial point of view.

The aims of the module are the following:

- To be able to explain the main problems to be considered when pre-sizing aircraft structures
- To be able to explain how aircraft structures are designed
- To be able to explain how thin walled structures are loaded
- To be able to compute the induced loads in thin-walled structures
- To be able to explain the stakes linked to F&DT
- To be able to perform elementary F&DT analyses

Pre-requisites:

- Fundamentals of continuum mechanics
- Fundamentals of Solid Mechanics
- Basic of Beam Theory

Organization

24x lectures including tutorials and project kick off (24x1h = 24h)

2x workshops (2x2h = 4h)

2x student projects (2x(0.5+0.5)h=2h for intermediate review and final defense)

Total: 30 hours (excluding written examination, revision time, work on project and personal work)

Evaluation

30%: 1 written exam (2h)

25%+25%: 1 oral defense for each of both projects (2x0.5h)

10%+10%: 2 workshops (2x2h)

Estimated personal work: 90 hours

US CREDIT HOURS / ECTS: 3 / 6

CONTENTS

- General architecture of aircraft structures
- Review of basic of Beam Theory
- Focus of Beam Theory on thin section walled section and hyperstatic condition
- Analysis of load transfer within joints through the use of the Beam Theory
- Emphasis on the thin walled structures
- Elements of Linear Fracture Mechanics and of Metallurgy in view of F&DT
- F&DT stakes and basic method for aircraft structures design

SS3 - French language and cultural discovery

<p>OBJECTIVES</p> <p>This course includes a welcoming module, French language classes and cultural workshops and visits in order to help students adapt the host country and make them familiar with their new environment.</p> <p>French classes based on levels:</p> <ul style="list-style-type: none"> Classes will be set up to help students achieve an A1, A2, B1 or B2 level by the end of the semester, according to their level when arriving. <p>Cultural aspects:</p> <ul style="list-style-type: none"> Learning about French culture and society Discovering a new environment <p>Organization:</p> <ul style="list-style-type: none"> Courses: 78h (beginners) / 72h (other levels) Workshops and visits: 15h Pupilage: 10h Personal work: 10h Total: 113 hours (beginners) 107 hours (other levels) <p>Evaluation: Continuous assessments (50%) A final written exam (50%): 2h</p> <p>US CREDIT HOURS / ECTS: 3 / 6</p> <p>CONTENTS</p> <p>French language:</p> <p>A1 level:</p> <ul style="list-style-type: none"> Basic grammar, familiar expressions and vocabulary to use in a concrete context to satisfy immediate needs: <ul style="list-style-type: none"> - Introducing oneself, introducing someone - Asking and answering questions - Topics related to personal relations and belongings (family, friends, accommodation...) Communication in everyday situations (asking in a polite way, doing some shopping, ordering in a restaurant...) 	<p>A2 level:</p> <ul style="list-style-type: none"> Grammatical tools, expressions and vocabulary to understand and express simple messages Topics related to personal relations and belongings, immediate environment and shared domain of interest Interacting in simple and short conversations <p>B1 level:</p> <ul style="list-style-type: none"> Grammatical tools, expressions and vocabulary to understand the main points of clear standard input on familiar matters regularly encountered in work, school, leisure, etc. Producing simple connected text on topics which are familiar or of personal interest. Describing experiences and events, dreams, hopes & ambitions and briefly give reasons and explanations for opinions and plans. <p>B2 level:</p> <ul style="list-style-type: none"> Grammatical tools, expressions and vocabulary to understand the main ideas of complex text on both concrete and abstract topics, including technical discussions in his/her field of specialization. Interacting with a degree of fluency and spontaneity that makes regular interaction with native speakers quite possible without strain for either party. Producing clear, detailed text on a wide range of subjects and explaining a viewpoint on a topical issue giving the advantages and disadvantages of various options. <p>Cultural matters:</p> <ul style="list-style-type: none"> Workshops on French culture Cultural Visits (The city of Toulouse, Aéroscopia, Cité de l'espace, museums ...) <p>Course director: Dorothée Lamour</p>

SS4 – Aerodynamics and Propulsion

OBJECTIVES In this course standard results of incompressible potential flow are revisited, along with key aspects of compressible flows, with the view of applications to both aerodynamics and propulsion. The aims of the module are the following: <ul style="list-style-type: none">○ To review conservation laws;○ To review key results of potential flow theory, including application to thin airfoils;○ To design an airfoil for a given set of constraints;○ To review finite wing theory;○ To study basic properties of two-dimensional transonic and supersonic flow;○ To study principles of gas turbine combustion. Pre-requisites: <ul style="list-style-type: none">○ Fundamentals of continuum mechanics○ Basic thermodynamics (BEng Mech Eng, BSc Physics)○ Gas Dynamics for Aerodynamics and Propulsion○ Fundamentals of viscous flows Organization 13x combined lectures-tutorials (40h) 3x labs (6h) Total: 46 hours (excluding examinations, revision time, and personal work-project) Estimated personal work and airfoil project: 46 + 20 hours Evaluation 3 lab session reports (2x10%+20%) 1 project reporting (20%) 1 intermediate written exam (1h) (10%) 1 final written exam (3h) (30%) US CREDIT HOURS / ECTS : 3 / 6	CONTENTS <ul style="list-style-type: none">○ Potential flows and the Kutta-Jukowski theorem○ Theory of thin airfoils and application to airfoil design○ The lifting-line theory, and non-optimized wing○ Introduction to airfoil and wing design○ Oblique shock waves○ Expansion○ Transonic flows○ Linearized flows○ Ideal gas model○ Propulsion principles○ The Ideal and Non-ideal Turboshift Cycle○ Thrust and Propulsive Efficiency. The Turbojet Cycle○ The Turbofan Cycle Bibliography : Anderson J D, Fundamentals of aerodynamics, 2001; ISAE: 629.132 3 AND Houghton E L, Carpenter P W, Aerodynamics for engineering students, 1960, 1993, 2003: ISAE: 629.132 3 HOU / P. SS5 – Preliminary Aircraft Design

OBJECTIVES

In this course key aspects of aircraft design will be presented, such as requirements, regulations, design process, aircraft loads, mass models, aerodynamic and propulsion models, aircraft stability. Interactions between disciplinary issues will also be explored.

The aims of the module are the following:

- To discover key engineering disciplines at play in preliminary aircraft design with emphasis on low fidelity models;
- To explore the potential trade-offs at preliminary design stage;
- To complete the preliminary design of a conventional aircraft and, to a limited extent, a less conventional aircraft (high aspect ratio, blended wing body...);
- To use an existing preliminary aircraft design process, with potentially limited software developments;
- To present the final work to peers (oral) and within a synthetic report;

Pre-requisites: none

Organization

10 x lectures (30h)
2 x industrial lectures (6h)

Total: 36 hours (excluding intermediate presentations, project work, review time, and personal work)

Estimated personal work: approx. 90 hours

Evaluation

1 project reporting (60%)
1 intermediate review on certification (10%)
1 industrial lectures reporting (10%)
1 final oral presentation (1h) (20%)

US CREDIT HOURS / ECTS : 3 / 6

CONTENTS

- Review of atmosphere properties
- Aircraft design requirements
- Aviation regulations and certification
- Aircraft loads, mass models
- Review of basic aircraft aerodynamics and stability, and propulsion models
- Preliminary design process
